November -2023

Executive Summary

1. Project Description

The proposed project is the modernization and Upgradation of Chennai Fishing Harbour, Kasimedu, Chennai. At present, the Chennai Fishing Harbour is spread on **31.956 Hectares** of land area and contains **48.56 Hectares** of water spread area within its breakwaters.

As per EIA Notification 2006, the proposed project site falls under 7(e)-Ports, Harbours, Breakwaters and Dredging. The category of the project is B1.

Project Proponent: Chennai Fishing Harbour is managed and operated by the Fishing Harbour Management Committee (FHMC). The Chairman of Chennai Port Trust is the Chairman of the FHMC.

The Committee has representations from the Ministry of Fisheries, Animal Husbandry and Dairying (GoI), the Department of Fisheries (GoTN), the Marine Product Export Development Authority (MPEDA), District Administration, the Central Institute of Coastal Engineering, Police and various fisheries unions.

1.1 Environmental Sensitive Areas

This section details with the environmentally sensitive areas present within the project site and surrounding environs. It included national parks, state forest, essential habitats etc. The environmental sensitive areas covering an aerial distance of 15 km from the project boundary is given in below Table.

Sr. No	Areas	Proposed project location boundary		
		Monuments	Dist (~km)	Direc
1	Areas protected under international conventions, national or local legislation for their ecological, landscape, cultural or other related value	Old Town Wall Tondiarpet	2.27	SSW
		Tomb of David Yale and Joseph Hymners in the compound of Law College Muthialpet(George Town)	4.09	SSW
		Ramparts gates bastions Ravelins with vaulted chambers and water cisterns underneath moat and defense walls all round with glacis to the extent of the existing barbed wire fence Fort St. George	4.54	SSW
		King's Barracks Block No.XXV Fort St. George	4.62	SSW
		Old British Infantry Officers Mess (Now housing the Fort Museum) Block No.XXXVI/2 Fort St. George	4.7	S
		Guard Room Block No.V Fort St. George	4.89	SSW
		St. Mary's Church with tablets laid on the ground and enclosed by a compound and a buried wall Fort St. George	4.92	S
		Clives House built in 1753 Fort St. George	4.96	SSW
		Nursing Sister's House (Block 1/3) Fort St. George	4.97	S
		Big Warehouse south of the Church Library (in Block No.II/7) Fort St. George	4.98	S
		Garrisons Engineer's Depot Block No.IV Fort St. George	5.03	SSW

	agriculture , fisheries, tourism, minerals)	
10	Areas already subjected to pollution or environmental damage (those where existing legal environmental standards are exceeded)	Nil
11	Areas susceptible to natural hazard which could cause the project to present environmental problems, (earthquakes, subsidence , landslides, erosion or extreme or adverse climatic conditions)	The study area falls under Zone-III (Moderate risk) according to the Indian Standard Seismic Zoning Map. Suitable seismic coefficients in horizontal and vertical directions respectively, will to be adopted while designing the structures. The place is also prone for Cyclone and Tsunami.

1.2 Proposed Facilities

The proposed project is the modernization and upgradation of Chennai Fishing Harbour, Kasimedu, Chennai.

At present, the Chennai Fishing Harbour is spread on **31.956 Hectares** of land area and contains **48.56 Hectares** of water spread area within its breakwaters.

Sr. No.	Description	Details																																																																										
1	Location	Kasimedu, Chennai.																																																																										
2	Survey Nos.	<p>The survey where the proposed project site is located are as follows: 3483, 3482, 3514, 3515, 3522, 3524, 4321, 4342, 4343, 3457, 3485, 3464, 3527, 3518.</p> <p>The sub-clause of the above mentioned S.F.Nos are as follows: 3312/2, 3457/1, 3457/2, 3457/3, 3463/3, 3463/4, 3464/1, 3464/2, 3473, 3482/1, 3482/3, 3483/1, 3483/2, 3483/3, 3484/1 pt, 3484/3, 3485 pt, 3514, 3515, 3518, 3522, 3524 pt, 3527/2, 3527/50, 3527/51, 3527/59, 3527/60, 3527/68, 3527/69, 3527/77, 3527/78, 3527/86, 3527/87, 3527/95, 3527/96, 3527/104, 3527/105, 3527/113, 3527/114, 3527/117, 4321, 4342, 4343 pt.</p>

4	Water Requirement	<p>During construction phase, approx 80 KLD will be required for both domestic and construction purpose.</p> <p>For existing, fresh water requirement of 200 KLD is been already and is sufficient for proposed phase also. The source of water will be met from dedicated pipeline from CMWSSB.</p> <p>Moreover, the RO Plants of capacity 25LPH & 500 LPH are to be proposed as Potable drinking water is a necessity for the users of the fishing harbour.</p> <p>The potable water at the harbour is primarily used in large quantities by the fishing boats (MFBs) before sailing out. On-shore fishermen, labourers, vendors, retailers and buyers also require potable water.</p> <p>For the storage of water, Ground Level Reservoir (GLR) and Over Head Tank (OHT) will be proposed. The water requirement given below is applicable both for Existing and Proposed Operation Phase.</p> <table border="1" style="width: 100%;"> <thead> <tr> <th>Sr.No.</th> <th>Description</th> <th>Water Requirement (KLD)</th> </tr> </thead> <tbody> <tr> <td>1.</td> <td>Domestic</td> <td>13</td> </tr> <tr> <td>2.</td> <td>Flushing</td> <td>20</td> </tr> <tr> <td>3.</td> <td>Washing (Floor/Fish)</td> <td>70</td> </tr> <tr> <td>4.</td> <td>Mechanized Fish Boats (MFB) Requirement</td> <td>97</td> </tr> <tr> <td colspan="2" style="text-align: center;">Total</td> <td>200</td> </tr> </tbody> </table>			Sr.No.	Description	Water Requirement (KLD)	1. 8	Proposed Project Cost	The total investment of the project is INR 89.62 Crore.																				

1.3 Hazardous waste Generation and Management

Hazardous waste materials are properly disposed as per the Hazardous and Other Wastes (Management and Trans boundary Movement) Amendment Rules, 2016. Hazardous waste collection, storage & disposal to authorized recyclers.

1.4 Solid waste generation and Management:

Sr.No	Waste type	Existing phase (kg/day)	Proposed phase (kg/day)	Management measure
1	Organic waste	1.44	1.44	Collected in Municipal Bins and directly disposed through Greater Chennai Corporation dumping yard at Kodungaiyur.
2	Inorganic waste	0.96	0.96	
Total		2.4	2.4	

1.5 Wastewater Generation

All the domestic sewage facilities will be equipped by proposing STP with SBR technology of capacity 40 KLD and the STP specification is attached as **Annexure 6**. Effluent generation from washing will be treated by proposing ETP of 80 KLD capacity and the ETP specification is attached as **Annexure 7**.

1.6 Decommissioning

Restoration and Rehabilitation

- The site is devoid of any forest or trees and hence there will be no change in the land use pattern and no land acquisition or conversion is required.
- Further, the site is devoid of any human habitations hence evacuation of the project-affected persons is not involved in this project.
- As per the NCCR Report, an integrated approach was used for studying the environmental parameters and biodiversity of the Chennai Fishing harbor.
- Satellite, drone images and ground truth survey indicate absence of mangroves in the study area. Mangroves are present 5.5 km and 13.5 km, North and South, respectively of the Chennai Fishing harbor.
- The closest turtle nesting site is located 13 km south, in the Besant Nagar -Neelankarai coastal stretch. Therefore, developmental activities in the Chennai Fishing harbour will have no influence on the turtle nesting sites.
- Based on the observations, we conclude that since mangroves were historically absent in the site and environmental conditions are unfavourable, plantation of mangroves is not recommended.
- Hence, no resettlement and rehabilitation issues are involved in the proposed project.

2. Description of the Environment

The baseline environmental studies were carried out during **Mid Jan 2023-Mid April 2023**.

2.1 Climatology

Month	Temp (°C)		Rainfall (mm)		Relative Humidity (%)		Vapour Pressure hPa		Mean Wind Speed (Km/hr)	Predominant Wind Directions (From)*

Nov	30.4	23.2	377.3	11.5	83	75	28.5	27.4	4.6	N	NE
Dec	29.4	21.7	183.7	5.7	83	69	25.7	24.1	5.0	N	NE
Max.	38.3	27.7	377.3	11.5	83	75	31.4	31.2	9.2	Annual predominant wind pattern is South East	
Min.	29.4	20.9	3.4	0.2	61	58	24.6	22.8	4.6		
Avg/Total	33.7	24.6	1408.4	60.2	75	65	28.1	27.7	6.8		

As per the above IMD Climatological the observations drawn are the following.

- Daily maximum temperature is 38.3°C and the daily minimum temperature is 20.9°C were recorded in the months of May and January respectively.
- Maximum and minimum relative humidity of 83% and 58% were recorded in the months of January, November, December and June respectively.
- Maximum and minimum rainfall of 377.3mm and 3.4mm was recorded in the months of November and March respectively.
- Maximum and minimum Mean wind speed is 9.2 Km/hr and 4.6 Km/hr was recorded in the months of May and November respectively. According to the above IMD data, Annual predominant wind pattern is from **South East**.

S. No	Parameter	Observation
1.	Temperature	Max Temperature : 38°C Min Temperature : 21°C Avg Temperature : 28.32°C
2.	Average Relative Humidity	74.44%
3.	Average Wind Speed	3.01 m/s
4.	Predominant Wind Direction	East

(Note: BLQ – Below Limit of Quantification; LOQ – Limit of Quantification; NR – No Relaxation)

3. Anticipated Environmental Impacts and mitigation measures

3.1 Air environment

Construction Phase:

Activities like site clearance; site levelling movements of workers and material, construction of road, transportation activities will generate dust, gaseous pollutants and particulate matter and affect the air quality. The other impacts include -

- Site Preparation-fencing, boundary and clearing of site will cause disturbance to the surroundings.
- Release of suspended particles (sediments) from dredging activities
- Excavation, backfilling and levelling.
- Hauling and dumping of earth materials and construction spoils.
- Foundation works can cause dust generation which will decrease the air quality and it can impact the labours working.
- Fabrication, erection of steel structures.
- Construction of internal roads drains and water supply.
- Cleaning and landscaping.
- Emission from Construction Equipments

Operation Phase:

The major activity at the harbour during operational phase is:

- Fishing markets
- Catchment of fishes
- Vehicular movements for the fish exports.

- No chemical process or any manufacturing activity involved; hence there will not be any process emission.
- No gases will be emitted even during the operation phase, as the major activity during this phase will be fish handling.
- The impact of the air pollution due these will be very negligible as the proposed project is in the coastal area.

Mitigation measures

Construction sites shall be enclosed with impermeable sheets or garden nets to prevent dust carry off. Water sprinkling shall be done at vulnerable areas.

- Pollution under control certificate shall be insisted for motor vehicles and relevant machinery.

- Earth and bulk filling materials shall be covered during transportation.
- Persons working close to sources of high emission shall be provided with protective gear such as mask and caps

3.2 Noise environment

Construction Phase

Noise during construction phase will involve movement and operation of machinery and equipment as well as handling, loading, unloading of materials. Operation of mixer machines, cranes, winch machine, dumpers, pile drivers, metal works etc., as well as movement of trucks will generate noise.

Operation Phase

During operational phase, the major source of noise:

1. Motor boat movements
2. Market prone area
3. From boat repair complex (to be proposed)
4. Ship Lifting Facility

However, this increase in noise level will be lower compared to the construction phase.

Mitigation measures

Air horns shall be prohibited in the project area. Sounding of horns(of other types) shall be allowed only in emergency.

- Sound level monitoring shall be done as specified by TNPCB norms.
- Persons working close to equipments generating high level of noise (85 dB (A)) shall be provided with personal protective equipment such as ear plugs.

Appropriate measures for minimizing noise from use of mechanical devices will be taken by the implementing agencies /contractors by adopting damping, absorption, dissipation and deflection methods and provision of acoustic enclosures, mufflers, noise sources isolators.

3.3 Soil environment

Construction Phase:

Generation of solid wastes is inevitable during both construction and operation phases. Solid generated during construction period will constitute debris, construction wastes, discarded metal items of construction utilities, spares and equipments, tyre, dry cell / batteries, etc. in addition, domestic wastes will be generated from the temporary labour camps at project site.

The likely impacts from such wastes will be on the soil and aquatic phase if it escapes into the water body. The impacts during construction phase will be temporary in nature and confined to the construction period only.

Operation Phase:

During the operation phase solid waste will constitute fish offal, discarded fish boxes, utility and plastic items, ropes, nets, dry cell / batteries, etc. in addition to domestic waste to be generated from the eatery, dormitory, etc., within the harbour complex.

The likely impacts from such wastes will be on soil, sanitation and water quality. Impacts during this phase will be continual, for which proper management plan will be implemented required for mitigation of such impacts.

Mitigation measures

- As STP of 40 KLD and ETP of 80 KLD is to be proposed all the wastes will be directed to the same. Therefore, no discharge of any waste will be released in the land.
- The Greenbelt will be proposed at the project site taking into consideration the availability of area as the efficacy of green belt in pollution control mainly depends on width of green belt, distance from pollution sources, and site of the habitat from working place and tree height & density.
- The green belt development will be carried out in the consultation with a local forest department wherever feasible, which will help in minimizing adverse impact on the flora found in the area.

3.4 Water environment**Construction Phase:**

Activities related to construction of training walls, dredging of entrance channel, land reclamation and revetment, quays, RC sloping hard, Beach landing slope, etc. will involve miscellaneous civil work, movement of construction materials, etc. which will have potential impacts.

Dredging and other construction activities will increase turbidity level in the water column. This will be short term and restricted to the construction period only.

The change in the drainage system due to construction of the training and dredging at the channel entrance with respect to tide, current and circulation will be temporary in nature and better flushing of the existing channel will offset any negative impact caused over period of time.

Operation Phase:

There will be no major impacts foreseen in the operation phase. Some of the biodegradable and non-biodegradable waste may discharge directly into the water.

Wastewater generated from the auction halls and post-cleaning process will be directed to proposed ETP and will be reused.

Mitigation measures

The water will be well stored in the Over Head Tank (OHT) and Low Level Reservoir (LLR). Drinking water arrangements by 5Nos. of RO with 25LPH capacity along with the 2Nos. of 500LPH capacity and 2Nos. of 1000L Storage Tanks. There will be no discharge of waste in direct to the water bodies as it will be emerged with the available existing 5 toilets.

3.5 Biological environment

- Sewage generated at different locations will be treated in septic tank – soak pit systems.
- Regular monitoring of the water parameters as recommended are to be made for review and further control measures, if found necessary on the basis of the monitoring reports. Monitoring reports are to be submitted to the statutory authorities at the periodicity specified by them.
- Oil spills from fishing vessels shall be contained and removed/dispersed with appropriate facilities.
- Wash-off from oil handling areas will be directed or conveyed into the effluent treatment plant consisting of bar screen, oil trap and settling unit. Sediment deposition at the training wall shall be cleared at least once in two years.
- Wash-water from auction hall will be sent to the effluent treatment plant consisting of bar screen, oil trap and settling unit.
- Washed water from the fish auction area will be connected to Effluent Treatment Plant consisting of bar screen, oil trap and settling tank prior to discharge into the sea.
- Surface water, ground water, marine water and discharge effluent quality shall be analysed regularly as detailed in the EMP.

4. Environmental Monitoring Program

Regular monitoring of important and crucial environmental parameters is of immense importance to assess the status of environment during operational phase. With the knowledge of baseline conditions, the monitoring program can serve as an indicator for any deterioration in environmental conditions due to operational phase and suitable mitigatory steps could be taken in time to safeguard the environment. Monitoring is as important as that of control of pollution since the efficiency of control measures can only be determined by monitoring. The following routine monitoring program will be implemented under the post project monitoring.

Environmental Monitoring Program during construction phase

Sr. No	Area of Monitoring	Number of Sampling Stations	Frequently of Sampling	Parameters to be Analyzed
1.	Ambient Air Quality	4 Stations	Twice a week:24 hourly period	PM10, PM2.5, SO _x , NO _x CO and TVOC

2.	Noise	4 (two within premises and two outside premises)	Weekly	Ambient Equivalent continuous Sound Pressure Levels (L_{eq}) at day and Night time.
3.	Surface water and Ground water	4 Stations (one within the premises and two outside premises)	Weekly	pH, Conductivity, TSS, TDS, BOD, COD, DO, Heavy metals (Ar, Pb, Ch, Ni etc), Chloride, Sulphate, Total Coliform
4.	Vehicular Emissions	2 Stations Inside and Outside premises	Weekly	Air emission and noise, PUC
5.	Soil	4 Stations (one within the premises and two outside premises)	Weekly	pH, Physicochemical properties like N,P,K,B,Cu, Heavy metals
6.	Terrestrial and Marine Ecology	Within 10 km radius	Weekly	Symptoms of injuries and total count of Phytoplankton, Flora, Fisheries productivity, benthic fauna .

5. Additional Studies

5.1 Risk Assessment

The Quantitative Risk Assessment study has been performed as dictated by the IS15656:2006 “HAZARD IDENTIFICATION AND RISK ANALYSIS - CODE OF PRACTICE” to give crucial insights on the hazards involved in mainly in the dredging process in the proposed project of Modernization and Upgradation of the Chennai Fishing Harbour, Kasimedu.

EVALUATE OR ACCESS THE RISK

Once the risk and affected persons have been identified, next step is to access the risk to protect the people from harm. There must be a defined risk rating to access the identified risk.

RISK RATING

One of the most simplistic forms of risk assessment is to rate the remaining risk as high, medium or low, depending on how likely the activity is to cause harm and how serious that harm might be. This is called ‘‘Risk rating’’.

LEVEL OF RISK

Low risk: It is most unlikely that harm would arise under the controlled conditions listed, and even if exposure occurred, the injury would be relatively slight.

Moderate risk: These types of risks are ones that could cause issues, but that there is still a lower chance that they will cause your work to fail. It is more likely that harm might actually occur and the outcome could be more serious. Minor injury is a typical example for this kind of risk.

High and extreme risk: These are the risks that take the highest priority. They can cause your work to fail, and you need to plan for these risks ahead of time. If injury is likely to arise and that injury might be serious like broken bones, trip to the hospital, loss of consciousness, or even a fatality.

Numerical scores are given to the different elements (e.g. consequence, exposure, likelihood) of risks and these scores are added or multiplied to get a rating for the risk.

ELEMENTS OF RISK

Probability: Risk probability, or likelihood, is the possibility of a risk event occurring. The likelihood can be expressed in both a qualitative and quantitative manner. The likelihood is the probability of loss when a sub-standard act occurs or sub-standard condition exists.

The likelihood should be based on the worst case scenario, ranging from a remote possibility to the inevitable. Factors affecting the likelihood include:

- Number of times the situation occurs
- Location of the hazard
- Duration of the exposure
- Environmental conditions
- Competence of the people involved

CONSEQUENCES

Consequences are the expected severity. The severity is expressed in terms of the effect on the person, whether injury or ill health, and ranging from minor injury to death. The risks are clearly higher if an accident is likely to result in serious injury or death.

RISK ANALYSIS

Once the hazard has been identified, it is necessary to assess what risk they pose to employees in the workplace. In this way we can establish a measure of the risk and determine what priority they should have for corrective actions. The risk assessment step is that part of the process that assesses the probability and consequences of hazard that have been identified. Once we have estimated the probability and consequences for each hazard then we can allocate it a priority for corrective action.

5.2 Seasonal Disaster Mapping

Features	Description
Earthquake	<ul style="list-style-type: none"> ➤ The District is located in Zone II of seismic vulnerability as captured in the Vulnerability Atlas. ➤ While earthquakes cannot be predicted, a detailed mapping of seismic fault systems and seismic source regions, quantification of probability of experiencing various strengths of ground motion at a site in terms of return

	period for an intensity will be carried out and appropriate regulations put in place to decrease the vulnerability of built environment.
Tsunami	<ul style="list-style-type: none"> ➤ So far as Tiruvallur District is concerned there are 3 costal talukas and as per Analysis of Mean Sea level of Tiruvallur there are 77 villages of 3 costal taluks in which Thiruvottiyur taluk are less than 1 km far from sea and on less than 10 meter of height from ocean level. ➤ Tsunami which struck the coast line of Tiruvallur District in the year 2004 took away the lives of 29 persons also caused extensive damage to property which made the livelihood of the coastal community a questionable one.
Cyclone	<ul style="list-style-type: none"> ➤ The largest low-pressure systems are cold-core polar cyclones and extra tropical cyclones which lie on the synoptic scale. Coastal Taluks viz., Thiruvottiyur, Ponneri and Gummidipoondi with coast line of 27.9 Kms are particularly prone. ➤ Cyclones originate out at sea and become hazardous when they come ashore. They also drive the sea level up to cause coastal flooding. ➤ At a community level, the TNSDMA has provided Multi-Purpose Evacuation Shelters at 5 locations. ➤ Further, Public Buildings, Choultries, Community Halls and buildings owned by various private educational institutions have also be identified for use as cyclone shelters, for evacuation and temporary occupation.
Oil Spillage	<ul style="list-style-type: none"> ➤ On 28th January - 2017 two ships namely MV BW Maple and MV MT Dawn Kancheepuram collided off the coast of Ernavur Village, Thiruvottiyur Taluk resulting into Bunker Oil Spill into the sea. ➤ The Tiruvallur distirct administration was actively involved in the oil spill removal process. Coast guard is the designated agency to tackle oil spill.
Fire	<p>Fire may be caused due to earthquakes, explosions, electrical malfunctioning and various other causes.</p> <p>Tiruvallur District has been listed in 'very high risk' category in view of the population density, residential built-up area and Industrial areas in the district.</p>

H: Human, A: Animals, I: Infrastructure

6. Project Benefits

6.1 Financial Benefits of the Project

- It plays a vital role in India's National Economy, contributing to the country's GDP, exports, food and nutritional security.
- The proposed activity will be a boost to the hub of the economic activity. As, the Chennai fishing harbour is one of the major harbour in our country and ninth among notified fish landing points.

6.2 Social Benefits of the Project

- Improvising the welfare of the fishermen community.

- This project will improve the livelihood of the fisher community
- This project will cater for the improvement of GDP.
- With the improvement of sanitation facilities, the health hazard including the water borne diseases are expected to be contained.
- Generation of direct and indirect employment during construction and operation phases.

7. Environmental Management Plan

Land environment

- The surface roads, which are proposed to be utilized during construction, shall be black topped to avoid fugitive dust.
- No new quarry is proposed to be specifically opened and the construction material is to be extracted from existing operating quarries, located outside the study area.
- Hence, project proponents are not required to implement management measures related to quarry slope stabilization.

Solid Waste Disposal

- Many of the waste items can be recycled and reused. This involves collecting and sorting the discarded materials suitable for recycling, paper, plastic, glass and aluminium cans, etc.
- Wet organic matter can be converted into compost. It is advisable to have separate containers to facilitate the segregation of wastes into bio-degradable and non biodegradable components.
- Floating garbage is best collected by small boats using a scoop net or two vessels working together using a floating net boom at the designated dumping areas of the local administration. Plastic drums of 100-litre capacity with airtight lids shall be bought and used to collect offal from fish markets or moored boats.
- Other organic fish wastes generated near the quay and auction hall area will be collected in air tight containers and sent to the organic waste composter, bio- mechanical composter of the local body.

Water Environment

- The major source of water pollution in the construction and operation phases is the sewage generated by the workers and employees. As a part of control of water pollution adequate numbers of community toilets connected to one septic tank will be constructed.

- The main source of wastewater generated during operation phase, will be the effluent generated from the fish washing, auction hall cleaning etc.
- The sewage will be generated from administrative block, toilet blocks etc. and it will be treated in septic tank.
- For treatment of sewage, an Effluent Treatment Plant and sewage treatment plant has been proposed within the fishery harbour.

Air Environment

The following measures are recommended to control air pollution:

- Contractor will be responsible for maintaining properly functioning of construction equipment to minimize exhaust.
- Construction equipment and vehicles will be turned off when not used for extended periods of time.
- Unnecessary idling of construction vehicles to be prohibited.
- Effective traffic management to be implemented.
- Road damage caused by sub-project activities will be promptly attended to with proper road repair and maintenance work.

Control of Pollution due to Increased Vehicles

- The vehicles emitting pollutants above the standards should not be allowed to ply either in the project construction or in the operation phases.
- Vehicles and construction equipment shall be fitted with internal devices i.e. catalytic converters to reduce CO and HC emissions.
- Water sprinkling shall be done at least thrice a day at the construction sites, haul roads and other access roads.
- Measures such as covering the trucks while transporting the construction material shall be initiated to control fugitive dust as also to control the re-suspension of particulate matters from the excavated materials.
- Staff involved in construction shall be provided with suitable Personnel Protective Equipment (PPE) such as dust masks, ear plugs, gum boots, gloves, etc.
- Idling of delivery trucks or other equipment shall be avoided during loading and unloading of construction material.

Noise Environment

- It is proposed to develop a greenbelt along the road stretches. The contractors will be required to maintain properly functioning equipment and comply with occupational safety and health standards.
- The construction equipment will be required to use available noise suppression devices and properly maintained mufflers.

- Ear protective devices should be used by the construction workers where they are exposed to steady noise levels above 85 dB.
- Noise from the DG set shall be controlled by providing an acoustic enclosure.
- To prevent the adverse effects of noise the exposure period of affected persons be limited as specified by Occupational Safety and Health Administration (OSHA).

Prevention of Soil Contamination

- Vehicle/machinery and equipment operation, maintenance and refueling will be carried out in such a fashion that spillage of fuels and lubricants does not contaminate the ground.
- Oil interceptors will be provided within the construction camps.
- All spills and collected petroleum products will be disposed off in accordance with CPCB norms.

Traffic Management

- The following measures are recommended as a part of Traffic Management Plan.
- Local villagers will be informed about the construction schedule.
- Traffic management with diversion through alternate routes will be implemented by providing adequate sign boards.
- Upon project completion, quick clearance of debris, etc. will facilitate access by customers to local business and residents to their households.
- Placement of traffic staff to facilitate easy of movement.

Odour Management

- A number of systems and indigenous low-cost methods are applied to reduce the impact of typical odour from fishing harbour areas.
- These technologies includes Odour neutralising agents, windbreak walls, Air scrubber, Bio filter, Short, Active oxygen, Ozone treatment, etc.

First-aid posts

- It is proposed to maintain one first-aid post manned by a qualified doctor and support staff during construction phase.
- The first-aid post will have all emergency medicines and appliances required for meeting emergencies arising during construction as well as a stand-by ambulance.
- The activities of this centre will include coordinating local vector control programmes / campaigns

Social Upliftment of the Fishermen Community

- The social upliftment of the local habitations and villages will include village roads, community halls, bus shelters, footpaths, distribution of free medicine, etc.

Dredging Management Plan

- It is proposed to carry out maintenance dredging activity within the fishing harbour to facilitate effective and optional utilization of harbour. The depth of the dredging is varying from 1- 2m in accordance with the site conditions.
- The area of dredging is 4,54,214 sq.m. Quantity of dredging material is 5,60,000 Cum.
- The dredged materials are proposed to be transported through self propelled dump barge (bottom open drop barge) .
- The impact on coastal environment during construction phase would be mainly from the activities in the inter-tidal phase due to construction of fishing harbour.

Sr.No.	Potential Direct Impacts	Potential Indirect Impacts
1.	Increased sediment Loading and deterioration in water quality	Impacts to fisher revenue stream for a shorter period of time
2.	Destruction/Entanglement of fishing gears	Decreased in the supply of catchment of fishes to the market
3.	Obstruction to travel routes	Reduced water quality

Hence, as a part of the management strategy various activities shall be well coordinated and optimized to avoid time and cost, which are given below:

- As part of conservation strategy, dredging will not be carried out during the fish breeding season.
- Dredging and construction activities to be scheduled and planned to minimize the impacts on fishermen and marine ecology providing necessary mechanisms to trap the spillage of fuel / engine oil and lubricants from the construction site to minimize impacts on benthos.
- Temporary colonies of the construction workers would be established sufficiently away from the High Tide Level (HTL) with adequate sanitation facilities and waste treatment measures. Construction debris shall be disposed safely in the designated areas.
- Proper covered storage area shall be used for dumping, transporting and disposal of the dredged material from the project site to designated dumping site outside the CRZ limits.
- Vehicles transporting reclamation materials must have their loads covered using tarpaulin or canvas sheet when utilizing the public road to prevent spillage of materials that can become a source of dust pollution.
- Minimise or even prevent dewatering or overflow from dredger.
- Good practice when loading and transporting unsuitable dredged material.
- Regular maintenance of ships and barges so as to prevent accidental leaks and spillage.
- Deflectors should be installed on the draghead and to ensure marine mammal and turtle observers are on board during dredge operations.

- As part of this exercise, the dredger will be equipped with spill response kits and dredging will be carried out in confined manner to reduce the impacts on marine environment.

All the standards preparatory will be taken to reduce the impact on marine water quality. Eventhough, the impacts will be for a shorter period only.
